(54) Title: SKIN COMPOSITION TO REPAIR THE EFFECTS OF PHOTOAGING

## (57) Abstract

The effects of photoaging or sun damage of skin including loss of collagen fibers and deterioration of small blood vessels in the dermis of the skin are repaired by applying topically to the epidermis effective amounts of a compound having structure (I), wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$  and  $R_5$  are independently selected from the group consisting of H, Cl,  $OR_6$ , straight or branched alkyl of 1 to 10 carbon atoms,  $NO_2$ ,  $COOR_6$ , CN,  $OR_6$ ,  $NR_6R_7$ ,  $NR_6C(=S)NR_7R_8$ ,  $NR_6COR_7$ ,  $SO_2NR_6R_7$ ,  $CH(CH_3)COOH$ ,  $CONR_6R_7$ ,  $COR_6$ ,  $OCONR_6R_7$ ,  $NR_6COONR_7$ ,  $R_9OR_6$ ,  $NR_6SO_2R_7$ ,  $Si(CH_3)_3$ , and  $NR_6CONR_7R_8$ ,  $R_3$  together with  $R_4$  forms a benzo ring or taken together with  $R_2$  forms a benzo or tetrahydrobenzo ring or together with  $R_2$  and  $R_1$  forms a (1) moiety or together with  $R_2$  forms a (2) moiety or  $R_2$  together with  $R_1$  forms a benzo ring or  $R_2$  together with  $R_3$  forms a (3) or (4) or (5) or (6) moiety, or  $R_1$  is independently selected from the group consisting of (7), (8) moiety,  $R_6$ ,  $R_7$  and  $R_8$  are independently selected from the group consisting of straight or branched alkyl containing from 1 to 10 carbon atoms, aryl containing from 6 to 10 carbon atoms and hydrogen, and  $R_9$  is alkylene of 1 to 6 carbon atoms, and iron carbonyl complexes thereof, to an area of the skin in an amount sufficient to repair the effects of elastosis in the skin. Lines and wrinkles due to aging are reduced and prevented.

### DESIGNATIONS OF "DE"

Until further notice, any designation of "DE" in any international application whose international filing date is prior to October 3, 1990, shall have effect in the territory of the Federal Republic of Germany with the exception of the territory of the former German Democratic Republic.

## SKIN COMPOSITION TO REPAIR THE EFFECTS OF PHOTOAGING

Cross-Reference to Related Applications

This application is a Continuation-In-Part  
5 of copending U.S. Application Serial No. 384,949  
filed on July 25, 1989.

Field of the Invention

This invention relates to a method of  
repairing the effects of aging of the skin,  
10 particularly human facial skin, by topical  
application of specific polyene compositions.

Background of the Invention

Excessive exposure of human skin to sunlight  
causes damage, resulting in a number of gross  
15 cutaneous changes. These include wrinkling, leather-  
iness, yellowing, looseness, roughness, dryness,  
mottling (pigment spots) and benign and malignant  
skin tumors. A person exhibiting these signs looks  
prematurely aged. Photoaging is most prominent in  
20 light skinned persons who brown easily and tan  
poorly. The effects of sunlight are cumulative. As  
a result, this sunlight-induced skin damage has been  
referred to as photoaging.

The majority of signs of photoaging can be  
25 prevented by judicious use of topically applied  
sunscreen agents. It is important to use sunscreens  
early in life, for example, as soon as a child begins  
to spend a significant amount of time outdoors.

Many persons will neglect to use sunscreens,  
30 and worse, some will intentionally overexpose them-  
selves to natural or artificial sunlight to benefit  
from cosmetic attributes of tanned skin. Later in  
life, they will seek medical care in the hope of  
alleviating the skin damage, for instance, by under-  
35 going cosmetic surgery.

-2-

A pharmaceutical composition that can promote the repair of photoaged skin is an alternative treatment to patients who neglect to use sun-screens and do not prefer cosmetic surgery. Topically applied all-trans retinoic acid is reported to improve the appearance of photoaged skin in open and double-blind studies. The beneficial changes were clinically significant to the investigators and the patients. These included effacement of fine wrinkles, reduced skin roughness, increased pinkening of the skin and lightening of pigmented sessions (lentigines, solar-induced freckles).

In the double-blind study, it was reported that 92 percent of patients experienced a dermatitis characterized by patchy erythema, localized swelling, xerosis, and mild scaling. Eleven of the patients needed potent topical steroids to alleviate the dermatitis. Three patients withdrew from the study because of the severity of retinoid-induced dermatitis.

It has been sought to provide a method for the treatment of photoaged skin, but without the adverse effects of dermatitis as noted with all-trans retinoic acid treatment.

The use of 13-cis-retinoic acid as a treatment for the adverse effects of elastosis is described in Australian Patent AU-A-83027187 by Hoffman-La Roche and European Patent Application Publication 0253393.

In U.S. Patent 4,595,696 certain polyenes are described as being useful in treating inflammatory or allergic conditions. These conditions, of course are far afield of photoaging and materials useful for the treatment of inflammatory conditions are not expected to be useful in the treatment of photoaging and vice versa.

-3-

In U.S. Patent 4,603,146 it is disclosed that all-trans retinoic acid (retin A) is useful in the treatment of photoaging. However, this treatment also results in great irritation to the skin, which severely limits its usefulness.

#### Summary of the Invention

The present invention relates to the use of specific polyenes in repairing the aging changes of exposed areas of the skin, especially the face.

These polyenes retard and reverse the loss of collagen fibers and deterioration of small blood vessels without substantially adversely affecting the patient.

The method of the invention comprises the repairing of sun-damaged skin comprising topically administering a compound having the structure:

wherein

$R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$  and  $R_5$  are independently selected from the group consisting of H, Cl,  $OR_6$ , straight or branched alkyl of 1 to 10 carbon atoms,  $NO_2$ ,  $COOR_6$ , CN,  $OR_6$ ,  $NR_6R_7$ ,  $NR_6C(=S)NR_7R_8$ ,  $NR_6COR_7$ ,  $SO_2NR_6R_7$ ,  $CH(CH_3)COOH$ ,  $CONR_6R_7$ ,  $COR_6$ ,  $OCONR_6R_7$ ,  $NR_6COONR_7$ ,  $R_9OR_6$ ,  $NR_6SO_2R_7$ ,  $Si(CH_3)_3$ , and  $NR_6CONR_7R_8$ .

$R_3$  together with  $R_4$  forms a benzo ring or taken together with  $R_2$  forms a benzo or tetrahydrobenzo ring or together with  $R_2$  and  $R_1$

35

-4-

forms a:

5

moiety or together with  $R_2$  forms a

10

moiety or  $R_2$  together with  $R_1$  forms a benzo ring  
or  $R_2$  together with  $R_3$  forms a

15

moiety, or

20

$R_1$  is independently selected from the  
group consisting of

25

moiety,

$R_6$ ,  $R_7$  and  $R_8$  are independently  
selected from the group consisting of straight or  
branched alkyl containing from 1 to 10 carbon atoms,  
aryl containing from 6 to 10 carbon atoms and  
hydrogen, and

30

$R_9$  is alkylene of 1 to 6 carbon atoms,  
and iron carbonyl complexes thereof,  
to an area of the skin in an amount  
sufficient to repair the effects of elastosis in the

-5-

skin. Lines and wrinkles due to aging are reduced and prevented.

The polyenes may be applied to the skin in any non-toxic, dermatologically acceptable vehicle, preferably a non-volatile emollient or lubricating vehicle in varied concentrations which is more fully described hereinbelow.

#### Detailed Description of the Preferred Embodiments

The treatment of skin with the polyenes of the present invention moderate and retard the aging changes in the skin to both the dermis and the epidermis. As age and exposure to sunlight increases, the skin's cells divide at a slower rate. The thickness of the epidermis decreases and the horny layer which protects against water loss sheds cells in large groups, resulting in rough, dry and scaling skin. The cells which make up the fiber of the dermis become smaller with increasing age with a loss of collagen fibers. The degradation of these fibers contributes to wrinkling and loss of elasticity.

The polyene compounds useful in the present invention have the structure:

30 wherein

$R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$  and  $R_5$  are independently selected from the group consisting of H, Cl,  $OR_6$ , straight or branched alkyl of 1 to 10 carbon atoms, for which examples are provided hereinbelow,  $NO_2$ ,  $COOR_6$ , CN,  $OR_6$ ,  $NR_6R_7$ ,  $NR_6C(=S)NR_7R_8$ ,  $NR_6COR_7$ ,  $SO_2NR_6R_7$ ,

-6-

CH(CH<sub>3</sub>)COOH, CONR<sub>6</sub>R<sub>7</sub>, COR<sub>6</sub>, OCONR<sub>6</sub>R<sub>7</sub>,  
 NR<sub>6</sub>COONR<sub>7</sub>, R<sub>9</sub>OR<sub>6</sub>, NR<sub>6</sub>SO<sub>2</sub>R<sub>7</sub>,  
 Si(CH<sub>3</sub>)<sub>3</sub>, and NR<sub>6</sub>CONR<sub>7</sub>R<sub>8</sub>,

R<sub>3</sub> together with R<sub>4</sub> forms a benzo ring  
 5 or taken together with R<sub>2</sub> forms a benzo or  
 tetrahydrobenzo ring or together with R<sub>2</sub> and R<sub>1</sub>  
 forms a:

moiety or R<sub>2</sub> together with R<sub>1</sub> forms a benzo ring  
 or R<sub>2</sub> together with R<sub>3</sub> forms a

moiety, or

25 R<sub>1</sub> is independently selected from the  
 group consisting of

moiety,

R<sub>6</sub>, R<sub>7</sub> and R<sub>8</sub> are independently  
 35 selected from the group consisting of straight or  
 branched alkyl containing from 1 to 10 carbon atoms,

-7-

for which examples are provided hereinbelow, and aryl  
containing from 6 to 10 carbon atoms and hydrogen,  
for which examples are provided hereinbelow, and

$R_9$  is alkylene of 1 to 6 carbon atoms,  
5 such as methylene, propylene, butylene, trimethylene,  
etc.

and iron carbonyl complexes thereof such as

15 For the purposes of this invention, examples  
of alkyl of 1 to 10 carbon atoms are methyl, butyl,  
pentyl, octyl, ethyl, tertiary-butyl, benzyl,  
isopropyl, chloroethyl, chloropropyl, hydroxypropyl,  
carboxyethyl, carboxymethyl, phenynyl, cyanoethyl,  
20 and 2-ethylhexyl and aryl of 6 to 10 carbon atoms are  
exemplified by phenyl and naphthyl.

The method of preparing these polyenes is  
well known and is generally described in U.S. Patent  
4,595,696 (incorporated herein by reference).

25 Generally, the compounds are formed by reaction of  
polyene acids with acetic anhydride, boron  
trifluoride, oxalkylene chloride, phosphorous  
trichloride or thionyl chloride and then further  
treated with phenolic compounds.

30 Useful polyenes within the scope of the  
present invention include those with the following  
structures:

-17-

The therapeutic agents of this invention may be administered alone or in combination with pharmaceutically-acceptable carriers, the proportion of which is determined by the solubility and chemical nature of the compound, chosen route of administration and standard pharmaceutical practice. For example, they may be administered orally in the form of tablets or capsules containing such excipients as starch, milk, sugar, certain of clay and so forth. They may be administered orally in the form of solutions which may contain coloring or flavoring agents. When applied topically for treatment of photoaging, they may be provided in the form of dusting powders, aerosol sprays, ointments, aqueous compositions including solutions and suspensions, cream lotions and the like. In this regard, any of the commonly employed extending agents can be used depending on the nature of the product as is well-known in the art.

The physician will determine the dosage of the present therapeutic agents which will be most suitable and it will vary with the form of administration and the particular compound chosen, and furthermore, it will vary with the particular patient under treatment. He will generally wish to initiate treatment with small dosages substantially less than the optimum dose of the compound and increase the dosage by small increments until the optimum effect under the circumstances is reached.

The polyenes which are formulated in moisturizing bases such as creams or ointments are usually provided in low concentrations. For example, Compound I may be used in concentrations of about 0.001 percent to 10 percent and preferably about 0.01 percent to 5 percent by weight of the base.

-18-

Other non-toxic, dermatologically acceptable vehicles or carriers in which the polyenes are stable will be evident to those of ordinary skill in the art. In general, emollient or lubricating vehicles, such as oleaginous substances, which help hydrate the skin are preferred. As used herein, the term "emollient" will be understood to refer to the non-irritating character of the composition as a whole. That is, the nature of the vehicle and amount of polyene therein should be selected so as to provide a sub-irritating dose for topical application. Volatile vehicles which dry or otherwise harm the skin, such as alcohol and acetone, should be avoided.

An ointment base (without water) is preferred in the winter and in subjects with very dry skin. Examples of suitable ointment bases are petrolatum, petrolatum plus volatile silicones, lanolin, and water in oil emulsions, such as Eucerin (Beiersdorf).

In warm weather and often for younger persons, oil in water emulsion (cream) bases, are preferred. Examples of suitable cream bases are Nivea Cream (Beiersdorf), cold cream (USP), Purpose Cream (Johnson & Johnson), hydrophilic ointment (USP), and Lubriderm (Warner-Lambert).

The length of treatment of human skin can vary. Usually, there is little point in beginning the treatments of the present invention until young adult life or, more typically, in middle age, when the effects of aging begin to appear. The particular program of maintenance therapy according to the present invention will vary depending upon the individual and conditions being treated. Generally, depending upon the age and state of the skin when treatments begin, it has been found that once a day

-19-

applications of polyenes for up to two months may be necessary to reduce and control the effects of aging which have already occurred. Once a stabilized skin control has been obtained, the frequency of application of the polyenes may be reduced, for example to two or three times a week, and in some cases only once a week for the rest of the person's life. That is, once the aging process has been controlled, a maintenance dose on the order of two applications per week is generally sufficient to maintain that state.

The topical compositions of this invention can, if desired, contain suitable sunscreen agents. Any conventional sunscreen agent can be utilized in formulating the polyenes formulations which can be utilized in accordance with this invention.

These topical compositions can contain any of the conventional excipients and additives commonly used in preparing topical compositions. Among the conventional additives or excipients which can be utilized in preparing these cosmetic compositions in accordance with this invention are preservatives, thickeners, perfumes and the like. In addition, the conventional antioxidants, such as butylated hydroxyanisoles (BHA), ascorbyl palmitate, propyl gallate, citric acid butylated hydroxy toluene (BHT), ethoxyquin and the like can be incorporated into these compositions. These topical compositions can contain conventional acceptable carriers for topical applications which are generally utilized in these compositions. These compositions may contain thickening agents, humectants, emulsifying agents and viscosity stabilizers, such as those generally utilized. In addition, these compositions can contain flavoring agents, colorants, and perfume which are conventional in preparing cosmetic compositions.

-20-

This invention is further illustrated by the following examples, which are illustrative only.

Example

A. Efficacy Tests

5           Compound II was tested for its effect on the differentiation of epidermis and dermis in hairless mice and directly compared to all-trans retinoic acid.

10           In the first test used, polyene compounds related to vitamin A, including all-trans retinoic acid, are highly effective in reducing the size of horn-filled utricles in hairless rhino mouse skin. The number of interutricular epidermal cells layers increases, concomitantly, as the size of the utricles diminish. Increased numbers of epidermal cell layers  
15 are also prominent in human photoaged skin treated with all-trans retinoic acid.

            Hairless rhino mice ( $hr^{rh}hr^{rh}$ ) from Temple University Skin and Cancer Hospital were treated with 0.05 ml of Compound II, all-trans  
20 retinoic acid or the ethanol:acetone (1:1) vehicle on the dorsolateral skin once daily on five consecutive days, for four weeks. Mice were sacrificed by CO<sub>2</sub> on the third day after the last treatments. A 7/8" punch biopsy of skin was removed and bisected in  
25 half. One of the halves was placed in 0.5 percent acetic acid overnight at 4°C so that horizontal epidermal sheets could be removed from each biopsy. The following day, epidermal sheets were removed from the dermis by peeling with a metal spatula. These  
30 sheets were fixed in formalin, dehydrated with ethanol, and kept in xylene. The other half of the biopsy was placed in 10 percent buffered formalin and processed into hematoxylin and eosin (H&E)-stained vertical sections.

35

-21-

To assess utricle diameter, each epidermal sheet was placed on a glass slide in a few drops of xylene. The diameter of 40 utricles was measured with an image analyzer. The epidermal thickness of 5 the H&E-stained sections was measured on 15 inter-utricular areas of each section with an image analyzer.

20		0.0001	37.6 $\pm$ 6.2	160

\*5 mice per group

Compound II was as effective as all-trans  
25 retinoic acid in increasing the interutricular  
epidermal thickness of rhino mice. This increase in  
epidermal thickness was due to an increase in the  
number of epidermal cell layers.

Polyene compounds are also evaluated for  
30 their effects on epidermal differentiation when they  
are applied to a non-wrinkled strain of hairless mice  
(hrhr). These mice have fewer horn-filled utricles  
in their skin compared to rhino mice. A variety of  
polyene compounds induce an increase in the number of  
35 epidermal cell layers when a compound is applied once  
to dorsal skin.

-24-

Hairless mice, obtained from Jackson Labs, had their dorsolateral skin treated twice, on Days 0 and 1, with 0.05 ml of Compound II, all-trans retinoic acid, or ethanol vehicle. At the peak of the epidermal hyperplasia, on Day 4, the mice were sacrificed by CO<sub>2</sub> and a 7/8" punch biopsy from the treated skin was removed and placed into 10 percent buffered formalin. H&E-stained vertical sections were prepared and the epidermal thickness in the interfollicular areas was measured with an image analyzer.

The results are shown in Table 3.

		0.001	33.3 ± 5.3	149

\* 5 mice per group.

20           At all three concentrations, Compound II caused the same degree of epidermal hyperplasia as the three equivalent concentrations of all-trans retinoic acid.

25           All-trans retinoic acid is known to affect the differentiation of cells in the dermis of hairless mouse skin, most effectively in the skin of mice that have been damaged by UV radiation. The formation of a new zone of connective tissue is accelerated in photoaged hairless mouse skin by topical treatment with all-trans retinoic acid. This is due to an increased number of fibroblasts and an increase in their metabolic activity. As a result, new collagen bundles and elastic fibers are formed, which leads to a compression of the old, abnormal elastic fibers by the newly created dermal matrix.

30

35

-26-

Female hairless mice (Skh-HR1), six to eight weeks old, obtained from Temple University Skin and Cancer Hospital, had their dorsal skin irradiated with ultraviolet B (UVB) radiation on Monday, Wednesday and Friday each week for ten weeks, using a bank of eight Westinghouse FS-40 sunlamps placed 16 cm above the back of the mice. During the first three weeks, the radiation dose per day was progressively increased from one minimal erythema dose (MED) to four MED's. The 4-MED dose per day was then continued for the last seven weeks.

At the end of ten weeks, irradiation was stopped and starting at week eleven, treatment with a 0.05 ml of ethanol vehicle, all-trans retinoic acid, or Compound II was given to the dorsal skin once daily for five consecutive days for ten weeks.

At the end of treatment, mice were sacrificed by cervical dislocation and dorsal skin was removed and placed in 10 percent buffered formalin. Paraffin-embedded sections were cut at 10  $\mu$ m thickness and stained with Luna's aldehyde fuchsin for elastic fibers. The dermal repair zone was measured microscopically and is defined as the area from the epidermal-dermal border to the top of the compressed elastotic material.

The results in Table 4 show that Compound II was as effective as all-trans retinoic acid in causing increased repair of the connective tissue zone.

B. Toxicity Tests

- 10 A rabbit model of skin irritation was used to assess the dermatitis produced by treatment with Compound II and all-trans retinoic acid. The rabbit is commonly used as a skin irritation model for predicting the potential local irritation of
- 15 topically applied materials.

- New Zealand albino rabbits, from Beckens Farms, Sanborn, N.Y., were clipped closely at four sites on the back with an electric hair clipper to give 4 cm X 4 cm square sites. Each rabbit received
- 20 0.2 ml of Compound II and all-trans retinoic acid, once daily for fourteen consecutive days. Each day, the degree of erythema, scaling and edema was assessed visually by using the Draize 0 to 4 grading method. The results were expressed as average daily
- 25 Draize score, which was derived by taking the cumulative score over fourteen days, for each parameter, and dividing by fourteen.

- Table 5 shows a comparison of three doses of Compound II (0.1, 0.01 and 0.001 percent) to 0.01
- 30 percent all-trans retinoic acid.

-29-

10 \* 10 rabbits.

The degree of irritation caused by Compound II even at ten times the dose of all-trans retinoic acid, is statistically lower than all-trans retinoic acid for erythema and scaling. Because of the  
15 variability associated with the edema scores, there were no statistically significant differences between any treatments, even though Compound II had numerically lower edema scores.

For the purposes of this invention, Global  
20 Irritation score is defined as the sum of the erythema, edema and scaling scores.

The toxicity induced by systemically administered Compound II was evaluated in albino mice. Vitamin A-related polyene compounds cause  
25 multiple signs of toxicity, referred to as the hypervitaminosis A syndrome, characterized by loss of body weight, skin scaling, hair loss and bone fractures.

Albino CD-1<sup>TM</sup> mice, from Charles River  
30 Laboratories, Wilmington, Ma., were administered Compound II and all-trans retinoic acid by intraperitoneal injection in peanut oil, at 8 ml/kg, once daily for five consecutive days, for two weeks.

Mice were graded daily during treatment for  
35 signs of hypervitaminosis A by the method of Bollag.

-31-

An animal is defined as having hypervitaminosis A when addition of the grades for loss of body weight, skin scaling, hair loss and bone fractures totals at least three.

5           The results are shown in Table 6. Compound  
II at 200 mg/kg, which was twice the highest dose of  
all-trans retinoic acid, did not cause hyper-  
vitaminosis A. In contrast, at 100 mg/kg, all-trans  
retinoic acid was so toxic that all ten of ten mice  
10 showed hypervitaminosis A and three mice treated with  
this dose died between Days 7 and 10.

## Compound II

15	200 mg/kg	0.1	$\pm$ 0.3
	50 mg/kg	0	$\pm$ 0
	20 mg/kg	0	$\pm$ 0
	Peanut Oil Vehicle	0	$\pm$ 0
	Untreated	0	$\pm$ 0

20

\* Retinoid-treated groups had 10 mice. Untreated and vehicle-treated groups had 5 mice. Each retinoid was evaluated in separate studies.

25 \*\* Based on 7 mice. Three mice died between Days 7 and 10.

In comparative treatment with 13-cis retinoic acid it was found that Compound II was approximately twice as effective as 13-cis retinoic acid and also caused less dermal irritation.

30 The invention has been described in detail with particular reference to preferred embodiments thereof, but it will be understood that variations and modifications can be effected within the spirit and scope of the invention.

35

-33-

What is claimed is:

1. A method of repairing sun-damaged human skin comprising topically administering a compound having the structure:

wherein

$R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$  and  $R_5$  are independently selected from the group consisting of H, Cl,  $OR_6$ , straight or branched alkyl of 1 to 10 carbon atoms,  $NO_2$ ,  $COOR_6$ , CN,  $OR_6$ ,  $NR_6R_7$ ,  $NR_6C(=S)NR_7R_8$ ,  $NR_6COR_7$ ,  $SO_2NR_6R_7$ ,  $CH(CH_3)COOH$ ,  $CONR_6R_7$ ,  $COR_6$ ,  $CONR_6R_7$ ,  $NR_6COONR_7$ ,  $R_9OR_6$ ,  $NR_6SO_2R_7$ ,  $Si(CH_3)_3$ , and  $NR_6CONR_7R_8$ ,

20  $R_3$  together with  $R_4$  forms a benzo ring or taken together with  $R_2$  forms a benzo or tetrahydrobenzo ring or together with  $R_2$  and  $R_1$  forms a:

moiety or together with  $R_2$  forms a

35

-34-

moiety or  $R_2$  together with  $R_1$  forms a benzo ring  
or  $R_2$  together with  $R_3$  forms a

moiety, or

$R_1$  is independently selected from the  
group consisting of

15 moiety,

$R_6$ ,  $R_7$  and  $R_8$  are independently  
selected from the group consisting of straight or  
branched alkyl containing from 1 to 10 carbon atoms,  
aryl containing from 6 to 10 carbon atoms and  
20 hydrogen, and

$R_9$  is alkylene of 1 to 6 carbon atoms,  
and iron carbonyl complexes thereof,  
to an area of the skin in an amount

25 sufficient to repair the effects of elastosis in the  
skin.

2. The method of claim 1 wherein  $R_2$  and  
 $R_3$  are independently selected from the group  
consisting of  $NR_6COR_7$ ,  $CONR_6R_7$ ,  
 $SO_2NR_6R_7$ ,  $ONR_6R_7$ ,  $NR_6COOR_7$ ,  
30  $NR_6CONR_7R_8$ ,  $NR_6SO_2R_7$  and  
 $NR_6C(=S)NR_7R_8$ .

3. A method according to claim 1 wherein  
 $R_3$  is  $NHCOCH_3$  and  $R_1$ ,  $R_2$  and  $R_4$  are H.

35

-35-

4. A method according to claim 1 wherein the compound has the structure:

5. A method according to claim 1 wherein the compound is selected from the group consisting of:

6. A method according to claim 1 wherein said skin is human facial skin.

7. A method according to claim 1 wherein said compound is applied in an emollient vehicle.

30 8. A method according to claim 1 wherein the compound is applied with a dermatologically acceptable carrier.

9. The method of claim 1 wherein the compound comprises about 0.001 to about 10 percent by weight of the mixture applied.

35 10. The method of claim 1 wherein the compound comprises about 0.01 to about 5 percent by weight of the mixture applied.

## FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V. ☒ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND incompletely searchable

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☒ Claim numbers .....\*..... because they relate to subject matter not required to be searched by this Authority, namely:

\* 1-10

See PCT Rule 39.1(iv): methods for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods

2. ☐ Claim numbers ..... because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claim numbers ..... because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING <sup>2</sup>

This International Searching Authority found multiple inventions in this international application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

## Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

**ANNEX TO THE INTERNATIONAL SEARCH REPORT  
ON INTERNATIONAL PATENT APPLICATION NO.**

US 9004052

SA 39094

This annex lists the patent family members relating to the patent documents cited in the above-mentioned international search report. The members are as contained in the European Patent Office EDP file on 26/11/90. The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
